ECOHOME Solar LED Skylight offer daylight without tubing and costly installation. The system can be installed at any location or multiple dwellings as there are no structural constraints or limitation as compared to standard tubular skylights. By installing the solar panel on the roof, running the interconnect cable through the roof space, and install the Ecohome Solar LED Skylight diffuser on your ceiling like any other light fixture. You will also be able to experience the sun up, sun down and cloud movement inside, just as you would experience with a standard skylight. There are multiple systems to complement your home and each model is better suited to different locations. These can include hallways, entrances, walk-in robes, bathrooms, laundries, pantries and restrooms. It can also suit larger rooms and anywhere that requires more light.
